

Splunk Alerts to Appdynamics Add-on

App Version : 1.0.0

Author : Gaurav Maniar (gauravmaniar63@gmail.com)

Description : Installation and configuration document

Prerequisite:

Before setting up this Alert Addon for Appdynamics, the following is needed from an Appdynamics administrator:

An Appdynamics administrator must create an API Client, a user for access of API client and Access Token which will be used by the Splunk Alert App to create Custom Event on Appdynamics. The API user should ideally belong to a system user as opposed to an actual “human” user.

Set-up Instruction:

Follow the guide on Appdynamics to create API Client and generate Access Token.
<https://docs.appdynamics.com/display/PRO45/API+Clients>

Once Access Token is created and the app is installed, follow the steps to configure the app.

1. Goto Splunk manage apps.
2. Look for “Splunk Alerts to Appdynamics” app and click on “Set Up”.

Splunk Alerts to AppDynamics	TA-splunk-alerts-to-appdynamics_addon	1.0.0	Yes	No	Global Permissions	Enabled Disable Set up Edit properties View objects
------------------------------	---------------------------------------	-------	-----	----	--------------------------------------	---

3. Now provide your Appdynamics environment URL and Access Token created before.

Alert Action - Appdynamics Configuration
Provide the following details to copy alert file to shared directory.

Appdynamics URL

https://demo.saas.appdynamics.com

Example - https://demo.saas.appdynamics.com

Access Token

aslkdjalksdjasdoqwje0q938493oirnqkwrq

Provide API access token to send events. Use the given link to create api token, [Click Here](#)

Cancel

Save

4. Once entered click “Save”.

Scheduling Alert to use Appdynamics action:

While scheduling the alert, select “Send to Appdynamics” action from the action menu. You can provide the following parameters for Custom Event to be created on Appdynamics app.

(Details on Custom Event parameter -

<https://docs.appdynamics.com/display/PRO45/Alert+and+Respond+API#AlertandRespondAPI-CreateaCustomEvent>)

- Severity – Error, Info, Warn
- Event Type – Custom or Application Deployment
- Application ID – Appdynamics Application ID
- Summary – Provide a summary describing event
- Comment – Provide the comments if any (It will be added in history/chat section)
- Include Result Link - It will append the Splunk Alert Result link to the comment and add it to history/chat section)
